The Mantys Package

MANuals for TYpSt

v0.1.3 2024-04-29 MIT

Helpers to build manuals for Typst packages.

Jonas Neugebauer

https://github.com/jneug/typst-mantys

Mantys is a Typst template to help package and template authors to write manuals. It provides functionality for consistent formatting of commands, variables, options and source code examples. The template automatically creates a table of contents and a command index for easy reference and navigation.

For even easier manual creation, MANTYS works well with TIDY, the Typst docstring parser.

The main idea and design was inspired by the LATEX package CNLTX by Clemens Niederberger.

Part I.

About

MANTYS is a Typst package to help package and template authors to write consistently formatted manuals. The idea is that, as many Typst users are switching over from TEX, they are used to the way packages provide a PDF manual for reference. Though in a modern ecosystem there are other ways to write documentation (like mdBook¹ or AsciiDoc²), having a manual in PDF format might still be beneficial, since many users of Typst will generate PDFs as their main output.

The design and functionality of Mantys was inspired by the fantastic LaTeX package CNLTX³ by Clemens Niederberger⁴.

This manual is supposed to be a complete reference of Mantys, but might be out of date for the most recent additions and changes. On the other hand, the source file of this document is a great example of the things Mantys can do. Other than that, refer to the README file in the GitHub repository and the source code for Mantys.

Mantys is in active development and its functionality is subject to change. Until version 1.0.0 is reached, the command signatures and layout may change and break previous versions. Keep that in mind while using Mantys.

Contributions to the package are very welcome!

Part II.

Usage

II.1. Using Mantys

Just import MANTYS inside your typ file:

```
#import "@preview/mantys:0.1.3": *
```

II.1.1. Initializing the template

After importing MANTYS the template is initialized by applying a show rule with the #mantys() command passing the necessary options using with:

```
#show: mantys.with(
...
)
```

#mantys() takes a bunch of arguments to describe the package. These can also be loaded directly from the typst.toml file in the packages' root directory:

```
#show: mantys.with(
..toml("typst.toml"),
...
)
```

```
#mantys(
  <name>: none,
  <title>: none,
  ⟨subtitle⟩: none,
  ⟨info⟩: none,
  ⟨authors⟩: (),
  ⟨url⟩: none,
  ⟨repository⟩: none,
  ⟨license⟩: none,
  ⟨version⟩: none,
  ⟨date⟩: none,
  <abstract>: [],
  <titlepage>: #titlepage,
  ⟨examples-scope⟩: (:),
  ..⟨args⟩
) [ < body > ]
```

```
Argument — (titlepage): #titlepage — none
```

A function that renders a titlepage for the manual. Refer to #name() for details.

```
Argument

(examples-scope): (:)

Default scope for code examples.

examples-scope: (
   cmd: mantys.cmd
)

For further details refer to #name().
```

All other arguments will be passed to #titlepage().

All uppercase occurrences of *(name)* will be highlighted as a packagename. For example MANTYS will appear as MANTYS.

II.2. Available commands

```
#add-type()
                            #cmdref()
                                                        #module-commands()
                            #command()
#arg()
                                                        #opt()
#args()
                            #default()
                                                        #relref()
#argument()
                            #doc()
                                                        #sarg()
                                                        #symbol()
#barg()
                            #dtype()
#choices()
                            #dtypes()
                                                        #value()
#cmd()
                            #func()
                                                        #var()
#cmd-label()
                            #lambda()
                                                        #var-label()
#cmd-selector()
                                                        #variable()
                            #meta()
```

II.2.1. Describing arguments and values

```
\#meta(\langle name \rangle) \rightarrow content
```

 $Highlight \ an \ argument \ name. \ \#meta[variable] \ \longrightarrow \ \langle variable \rangle$

```
Argument (name) str | content Name of the argument.
```

$\#value(\langle value \rangle) \rightarrow content$

Shows (value) as content.

- #value("string") → "string"
- #value([string]) → [string]
- $\#value(true) \rightarrow true$
- #value(1.0) \rightarrow 1.0
- #value(3em) \longrightarrow 3em
- #value(50%) \longrightarrow 50%
- #value(left) → left

```
• #value((a: 1, b: 2)) \rightarrow (a: 1, b: 2)
  ⟨value⟩
                                                                                             any
   Value to show.
\#default(\langle value \rangle) \rightarrow content
  Highlights the default value of a set of #choices().

    #default("default-value") → "default-value"

  • #default(true) → true
  • #choices(1, 2, 3, 4, default: 3) \rightarrow 1|2|3|4
 ⟨value⟩
                                                                                             any
   The value to highlight.
\#doc(\langle target \rangle, \langle name \rangle: none, \langle anchor \rangle: none, \langle fnote \rangle: false) \rightarrow content
  Create a link to the reference documentation at https://typst.app/docs/reference/.
        See the #doc("meta/locate") function.
    See the locate function.
 ⟨target⟩
                                                                                             str
   Path to the subpage of https://typst.app/docs/reference/. The lowercase command
   for example is located in the category text and has \target\: "text/lowercase".
 <name>: none
                                                                                             str
   Optional name for the link. With auto, the \(\tau\) target\) is split on \(/\) and the last part is used.
 ⟨anchor⟩: none
                                                                                             str
   An optional HTML page anchor to append to the link.
 ⟨fnote⟩: false
                                                                                            bool
   Show the reference link in a footnote.
#add-type(<name>, <target>: none, <color>: "theme.colors.dtypes.type")
  Adds a custom type to link to a type definition in the manual.
 ⟨name⟩
                                                                                             str
   Name for the new type.
```

```
str | label | location | dictionary
 ⟨target⟩: none
   Target to link the type to. Can be anything the link function accepts.
 <color>: "theme.colors.dtypes.type"
                                                                                        color
   A color for the type.
\#dtype(\langle type \rangle, \langle fnote \rangle: false, \langle parse-type \rangle: false) \rightarrow content
  Shows a highlightd data type with a link to the reference page.
  (t) may be any value to pass to type to get the type or a str with the name of a datatype.
  To show the string type, use #dtype("string"). To force the parsing of the values type, set
  ⟨parse-type⟩: true.

    #dtype("int") → int

  • \#dtype(1) \rightarrow int
  • #dtype(1deg) → angle
  • #dtype(true) → bool
  • \#dtype(()) \rightarrow array

    #dtype(red) → color

  Custom types can be added with #add-type().
 ⟨type⟩
                                                                                           any
   Either a value to take the type from or a string with the dataype name.
 ⟨fnote⟩: false
                                                                                          bool
   If true, the reference lin kis shown in a footnote.
 ⟨parse-type⟩: false
                                                                                          bool
   If \langle t \rangle should always be passed to type.
#dtypes(..⟨types⟩, ⟨sep⟩: "box(inset:(left:1pt,right:1pt), sym.bar.v)") → content
  Shows a list of datatypes.

    #dtypes(false, "integer", (:)) → bool int | dictionary

 ..⟨types⟩
                                                                                           any
   List of values to get the type for or strings with datatype names.
\#arg(..\langle args \rangle) \rightarrow content
  Shows an argument, either positional or named. The argument name is highlighted with
```

#meta() and the value with #value().

```
#arg[name] → ⟨name⟩
#arg("name") → ⟨name⟩
#arg(name: "value") → ⟨name⟩: "value"
#arg("name", 5.2) → ⟨name⟩: 5.2
```

```
..⟨args⟩
```

Either an argument name (str) or a (name: value) pair either as a named argument or as exactly two positional arguments.

$\#barg(\langle name \rangle) \rightarrow content$

Shows a body argument.

Body arguments are positional arguments that can be given as a separat content block at the end of a command.

• $\#barg[body] \rightarrow [\langle body \rangle]$

$\#sarg(\langle name \rangle) \rightarrow content$

Shows an argument sink.

• $\#sarg[args] \rightarrow ..\langle args \rangle$

```
Argument (name) str
```

$\#args(..\langle args \rangle) \rightarrow array$

Creates a list of arguments from a set of positional and/or named arguments.

str s and named arguments are passed to #arg(), while content is passed to #barg(). The result is to be unpacked as arguments to #cmd().

```
#cmd( "conditional-show", ..args(hide: false, [body]) )
#conditional-show(<hide>: false)[<body>]
```

```
— Argument — any
```

Either an argument name (str) or a (name: value) pair either as a named argument or as exactly two positional arguments.

```
\#choices(\langle default \rangle: "\_none\_", ..\langle values \rangle) \rightarrow content
```

Shows a list of choices possible for an argument.

If <default> is set to something else than "__none__", the value is highlighted as the default choice. If <default> is already given in <values>, the value is highlighted at its current position. Otherwise <default> is added as the first choice in the list.

```
#choices(left, right, center) → left|right|center
#choices(left, right, center, default:center) → left|right|center
#choices(left, right, default:center) → center|left|right
#arg(align: choices(left, right, default:center)) → ⟨align⟩: center|left|right
```

```
\#symbol(\langle name \rangle, \langle module \rangle: none) \rightarrow content
```

Shows a Typst reserved symbol argument.

```
• \#symbol("dot") \rightarrow dot
```

- #symbol("angle.1", module:"sym") \rightarrow sym.angle.1
- $\#arg(format: symbol("angle.l", module:"sym")) \rightarrow \langle format \rangle: sym.angle.l$

```
#func((name), (module): none)
```

Create a function argument. Function arguments may be used as an argument value with #arg().

```
    #func("func") → #func
```

- #func("clamp", module:"calc") → #calc.clamp
- $\#arg(format: func("upper")) \rightarrow \langle format \rangle: \#upper$

```
\#lambda(..\langle args \rangle, \langle ret \rangle: none) \rightarrow content
```

Create a lambda function argument. Lambda arguments may be used as an argument value with <code>#arg()</code>. To show a lambda function with an argument sink, prefix the type with two dots.

```
    #lambda("integer", "boolean", ret:"string") → (int, bool) => str
```

- #lambda("..any", ret: "boolean") \rightarrow (..any) => bool
- #arg(format: lambda("string", ret:"content")) → ⟨format⟩: (str) => content

II.2.2. Describing commands

Renders the command name with arguments and adds an entry with kind: "command" to the index.

⟨args⟩ is a collection of positional arguments created with #arg(), #barg() and #sarg().

All positional arguments will be rendered first, then named arguments and all body arguments will be added after the closing paranthesis.

```
• \#cmd("cmd", arg[name], sarg[args], barg[body]) \rightarrow \#cmd(\langle name \rangle, ..\langle args \rangle)[\langle body \rangle]
```

```
• \#cmd("cmd", ..args("name", [body]), sarg[args]) \rightarrow \#cmd(\langle name \rangle, ..\langle args \rangle)[\langle body \rangle]
  ⟨name⟩
                                                                                                 str
    Name of the command.
  <module>: none
                                                                                                 str
   Name of a module, the command belongs to.
  ⟨ret⟩: none
                                                                                                 any
    Returned type.
  ⟨index⟩: true
                                                                                               bool
    Whether to add an index entry.
  ⟨unpack⟩: false
                                                                                               bool
   If true, the arguments are shown in separate lines.
  ..⟨args⟩
                                                                                                 any
    Arguments for the command, created with the argument commands above or #args().
\#opt(\langle name \rangle, \langle index \rangle: true, \langle clr \rangle: rgb("\#0074d9")) \rightarrow content
  Shows the option (name) and adds an entry with (kind): "option" to the index.
  • #opt[examples-scope] → examples-scope
                                                                                     str content
  ⟨name⟩
    Name of the option.
  ⟨index⟩: true
                                                                                                bool
    Whether to create an index entry.
  <clr>: rgb("#0074d9")
                                                                                              color
    A color
\#var(\langle name \rangle) \rightarrow content
  Shows the variable \langle name \rangle and adds an entry to the index.
```

• $\#var[colors] \rightarrow \#colors$

```
\#cmd-label(\langle name \rangle, \langle module \rangle: "") \rightarrow label
  Creates a label for the command with name <name>.
  ⟨name⟩
                                                                                                       str
    Name of the command.
  ⟨module⟩: ""
                                                                                                       str
    Optional module name.
\#var-label(\langle name \rangle, \langle module \rangle: "") \rightarrow label
  Creates a label for the variable with name <name>.
  ⟨name⟩
                                                                                                       str
    Name of the variable.
  <module>: ""
                                                                                                       str
    Optional module name.
\#command(\langle name \rangle, \langle label \rangle: auto, ...\langle args \rangle)[\langle body \rangle] \rightarrow content
  Displays information of a command by formatting the name, description and arguments.
  See this command description for an example.
  ⟨name⟩
                                                                                                       str
    Name of the command.
  ⟨label⟩: auto
                                                                                                       str
    Custom label for the command. Defaults to auto.
  ..⟨args⟩
                                                                                                  content
    List of arguments created with the argument functions like #arg().
  ⟨body⟩
                                                                                                  content
    Description for the command.
\#variable(\langle name \rangle, \langle types \rangle): none, \langle value \rangle: none, \langle label \rangle: auto)[\langle body \rangle] \rightarrow content
  Displays information for a variable defintion.
```

```
#variable("primary", types:("color",), value:green)[
         Primary color.
       ]
    #primary:rgb("#2ecc40")
                                                                                    color
        Primary color.
 ⟨name⟩
                                                                                      str
   Name of the variable.
 <types>: none
                                                                                    array
   Array of types to be passed to #dtypes().
 ⟨value⟩: none
                                                                                      any
   Default value.
                                                                                  content
 ⟨body⟩
   Description of the variable.
#argument(
  ⟨name⟩,
  ⟨is-sink⟩: false,
  <types>: none,
  ⟨choices⟩: none,
  <default>: "__none__"
) [\langle body \rangle] \rightarrow content
  Displays information for a command argument. See the argument list below for an example.
 ⟨name⟩
                                                                                      str
   Name of the argument.
 ⟨is-sink⟩: false
                                                                                     bool
   If this is a sink argument.
 <types>: none
                                                                                    array
   Array of types to be passed to #dtypes().
 ⟨choices⟩: none
                                                                                    array
```

Optional array of valid values for this argument. ⟨default⟩ any Optional default value for this argument. ⟨body⟩ content Description of the argument. $\# module - commands(\langle module \rangle)[\langle body \rangle] \rightarrow content$ A wrapper around #command() calls that belong to an internal module. The module name is displayed as a prefix to the command name. #module-commands("mty")[#command("rawi")[Shows #arg[code] as inline #doc("text/raw") text (with #arg(block: false)).] #mty.rawi() Shows (code) as inline raw text (with (block): false). <module> str Name of the module. content ⟨body⟩ Content with #command() calls. $\#cmd-selector(\langle name \rangle) \rightarrow selector$ Creates a selector for a command label. ⟨name⟩ str Name of the command. $\#cmdref(\langle name \rangle, \langle module \rangle: none, \langle format \rangle: (...) \Rightarrow ...) \rightarrow content$ Creates a reference to a command label. ⟨name⟩ str Name of the command.

```
str
  <module>: none
   Optional module name.
                                                                                      function
 \langle format \rangle: (...) => ...
   Function of (str, location) => content to format the reference. The first argument
   is the name of the command (the same as <name>) and the second is the location of the
   referenced label.
\#relref(\langle label \rangle) \rightarrow content
  Creats a relative reference showing the text "above" or "below".
  • #relref(cmd-label("meta")) \rightarrow above
  • #relref(cmd-label("shortex")) \rightarrow below
 ⟨label⟩
                                                                                         label
   The label to reference.
#cmd-
     Same as #cmd(), but does not create an index entry.
#opt-
     Same as #opt(), but does not create an index entry.
#var-
     Same as #var(), but does not create an index entry.
```

II.2.3. Source code and examples

Mantys provides several commands to handle source code snippets and show examples of functionality. The usual raw command still works, but theses commands allow you to highlight code in different ways or add line numbers.

Typst code examples can be set with the #example() command. Simply give it a fenced code block with the example code and Mantys will render the code as highlighted Typst code and show the result underneath.

```
#example[```
This will render as *content*.

Use any #emph[Typst] code here.

```]

This will render as *content*.

Use any #emph[Typst] code here.

This will render as content.

Use any Typst code here.
```

The result will be generated using eval and thus run in a local scope without access to imported functions. To pass your functions or modules to #example() either set the examplesscope option in the intial #mantys() call or pass a (scope) argument to #example() directly.

See below for how to use the #example() command.

```
To use fenced code blocks in your example, add an extra backtick to the example code:
```

#example(\(\side-by-side\): false, \(\cdot\)imports\(\cdot\): (:), \(\cdot\)mode\(\cdot\): "code")[\(\cdot\)example-code\\)] (\(\cdot\) as a raw block with \(\lang\): "typ" and the result of the code beneath.
[\(\cdot\)example-code\\] need to be raw code itself.

```
#example[```
 Some lorem ipsum:\
 #lorem(40)
```]
```

```
*Some lorem ipsum:*\
#lorem(40)
```

Some lorem ipsum:

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aeque doleamus animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere.

```
— Argument — content content
```

A block of raw code representing the example Typst code.

```
\(\side-by-side\): false \(\none\)
```

Usually, the <example-code is set above the <result > separated by a line. Setting this to true will set the code on the left side and the result on the right.

```
\(\scope\): (:) \(\none\)
```

The scope to pass to eval.

Examples will always import the examples-scope set in the initial #mantys() call. Passing this argument to an #example() call additionally make those imports available in thsi example. If an example should explicitly run without imports, pass (scope): none:

```
#example[`I use #opt[examples-scope].`]

#example(scope:none)[```
// This will fail: #opt[examples-scope]
I can't use `#opt()`, because i don't use `examples-scope`.
```]
```

```
Argument—
(mode): "code"

The mode to evaluate the example in. See eval/mode for more information.
```

```
\(\text{Argument} \) \(\text{content} \)
```

The result of the example code. Usually the same code as <code><example-code></code> but without the raw markup. See below for an example of using <code>[<result>]</code>.

```
⟨result⟩ is optional and will be omitted in most cases!
```

Setting \(\side-by-side\): true will set the example on the left side and the result on the right and is useful for short code examples. The command \(\psiside-by-side()\) exists as a shortcut.

```
#example(side-by-side: true)[```
 Some lorem ipsum:\
 #lorem(20)
    ```]

*Some lorem ipsum:*\
    #lorem(20)

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat.
```

[\(\exists \text{cample-code}\)] is passed to \(\pi\mu\text{mty.sourcecode}()\) for processing.

If the example-code needs to be different than the code generating the result (for example, because automatic imports do not work or access to the global scope is required), #example() accepts an optional second positional argument [<result>]. If provided, [<example-code>] is not evaluated and [<result>] is used instead.

```
\label{lem:code} $$\#side-by-side(\langle scope\rangle: (:), \langle mode\rangle: "code")[\langle example-code\rangle][\langle result\rangle]$$ Shortcut for $\#example(\langle side-by-side\rangle: true).
```

```
#sourcecode(\langle title \rangle: none, \langle file \rangle: none)[\langle code \rangle]
```

If provided, the <title> and <file> argument are set as a titlebar above the content.

```
Argument ______ content
```

A #raw() block, that will be set inside a bordered block. The raw content is not modified and keeps its <lang> attribute, if set.

```
Argument—
(title): none

A title to show above the code in a titlebar.
```

```
Argument

(file): none

A filename to show above the code in a titlebar.
```

#sourcecode() will render a raw block with linenumbers and proper tab indentions using CODELST and put it inside a #mty.frame().

If provided, the <title> and <file> argument are set as a titlebar above the content.

```
#sourcecode(title:"Some Rust code", file:"world.r")[```rust
fn main() {
  println!("Hello World!");
  }
  ```]

Some Rust code

fn main() {
 println!("Hello World!");
 }
}
```

#### #codesnippet()[⟨code⟩]

A short code snippet, that is shown without line numbers or title.

```
#codesnippet[```shell-unix-generic
git clone https://github.com/jneug/typst-mantys.git mantys-0.0.3
```]

git clone https://github.com/jneug/typst-mantys.git mantys-0.0.3
```

#shortex(\langle sep : sym.arrow.r)[\langle code \rangle]

Display a very short example to highlight the result of a single command. (sep) changes the separator between code and result.

```
- #shortex(`#emph[emphasis]`)
- #shortex(`#strong[strong emphasis]`, sep:"::")
- #shortex(`#smallcaps[Small Capitals]`, sep:sym.arrow.r.double.long)

• #emph[emphasis] → emphasis
• #strong[strong emphasis]:: strong emphasis
• #smallcaps[Small Capitals] ⇒ SMALL CAPITALS
```

II.2.4. Other commands

#package()

Shows a package name:

- #package[tablex] → TABLEX
- $\#mty.package[tablex] \rightarrow TABLEX$

#module()

Shows a module name:

- #module[mty] → mty
 #mty.module[mty] → mty
- #doc(\langle target\rangle, \langle name\rangle: none, \langle fnote\rangle: false)

Displays a link to the Typst reference documentation at https://typst.app/docs. The <target> need to be a relative path to the reference url, like "text/raw". #doc() will create an appropriate link URL and cut everything before the last / from the link text.

The text can be explicitly set with <code>(name)</code>. For <code>(fnote: true)</code> the documentation URL is displayed in an additional footnote.

```
Remember that #doc("meta/query") requires a #doc("meta/locate", name:"location") obtained by #doc("meta/locate", fnote:true) to work.
```

Remember that query requires a location obtained by locate⁵ to work.

Footnote links are not yet reused if multiple links to the same reference URL are placed on the same page.

#command-selector(<name>)

Creates a selector for the specified command.

⁵https://typst.app/docs/reference/meta/locate

```
// Find the page of a command.
#let cmd-page( name ) = locate(loc => {
    let res = query(cmd-selector(name), loc)
    if res == () {
        panic("No command " + name + " found.")
    } else {
        return res.last().location().page()
    }
})
The #cmd-[mantys] command is documented on page #cmd-page("mantys").
The #mantys() command is documented on page 3.
```

II.2.5. Using Tidy

MANTYS can be used with the docstring parser TIDY, to create a manual from the comments above each function. See the TIDY manual for more information on this.

MANTYS ships with a TIDY template and a helper function to use it.

#tidy-module() calls #tidy.parse-module() and #tidy.show-module() on the provided <tidy> instance. If no instance is provided, the current TIDY version from the preview repository is used.

Setting (include-examples-scope): true will add the examples-scope passed to #mantys() to the evaluation of the module.

To extract headings up to a certain level from function docstrings and showing them between function documentations, set <code><extract-headings></code> to the highest heading level that should be extract-headings>: none disables this.

This manual was compiled with $\langle extract-headings \rangle$: 3 and thus the Section II.2.1 heading was shown before the description of #api.meta().

II.2.6. Templating and styling

```
⟨urls⟩,
⟨version⟩,
⟨date⟩,
⟨abstract⟩,
⟨license⟩
```

)

The #titlepage() command sets the default titlepage of a Mantys document.

To implement a custom title page, create a function that takes the arguments shown above and pass it to #mantys() as <titlepage>:

```
#let my-custom-titlepage( ..args ) = [*My empty title*]
#show: mantys.with(
    ..toml("typst.toml"),
    titlepage: my-custom-titlepage
)
```

A <titlepage> function gets passed the package information supplied to #mantys() with minimal preprocessing. The function has to check for none values for itself. The only argument with a guaranteed value is <name>.

II.2.7. Utilities

Most of MANTYS functionality is located in a module named mty. Only the main commands are exposed at a top level to keep the namespace pollution as minimal as possible to prevent name collisions with commands belonging to the package / module to be documented.

The commands provide some helpful low-level functionality, that might be useful in some cases.

Some of the utilities of previous versions are now covered by TOOLS4TYPST.

```
#gitlink()
#add-mark()
                                                        #name()
#alert()
                            #has-mark()
                                                        #package()
#author()
                            #idx()
                                                        #pkglink()
#cblock()
                            #idx-term()
                                                        #place-marker()
#code-example()
                            #make-index()
                                                        #rawc()
#date()
                            #marginnote()
                                                        #rawi()
#footlink()
                            #marker()
                                                        #sourcecode()
#frame()
                            #module()
                                                        #ver()
```

```
#mty.rawi(⟨lang⟩: none)[⟨code⟩] → content
Shows ⟨code⟩ as inline raw text (with ⟨block⟩: false).
• #mty.rawi("some inline code") → some inline code
```

```
Argument (code)

String content to be displayed as raw.
```

str ⟨lang⟩: none Optional language for syntax highlighting. $\#mty.rawc(\langle color \rangle)[\langle code \rangle] \rightarrow content$ Shows <code> as inline raw text (with <block>: false) and with the given <color>. This supports no language argument, since (code) will have a uniform color. • #mty.rawc(purple, "some inline code") → some inline code ⟨color⟩ color Color for the raw text. ⟨code⟩ content String content to be displayed as raw. $\#mty.cblock(\langle width \rangle: 90\%, ..\langle args \rangle)[\langle body \rangle] \rightarrow content$ A block that is centered in its parent container. #mty.cblock(width:50%)[#lorem(40)] Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aeque doleamus animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere. ⟨width⟩: 90% length Width of the block. ..⟨args⟩ anv Argeuments for block. $\langle body \rangle$ content Content of the block $\#mty.frame(..\langle args \rangle) \rightarrow content$ Create a frame around some content.

Uses Showybox and can take any arguments the #showybox() command can take.

```
#mty.frame(title:"Some lorem text")[#lorem(10)]
      Some lorem text
      Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do.
  ..args (any): Arguments for SHOWYBOX.
#mty.alert(
  <color>: rgb("#0074d9"),
  ⟨width⟩: 100%,
  ⟨size⟩: 0.88em,
  ..⟨style⟩,
  ⟨body⟩
  An alert box to highlight some content.
    Uses SHOWYBOX and can take any arguments the #showybox() command can take.
        #mty.alert(color:purple, width:4cm)[#lorem(10)]
      Lorem ipsum dolor
      sit amet, consectetur
      adipiscing elit, sed do.
\# mty.marginnote(\langle pos \rangle \colon \ left, \ \langle gutter \rangle \colon \ \textbf{0.5em}, \ \langle dy \rangle \colon \ "\textbf{-1pt"})[\langle body \rangle] \longrightarrow \ \textbf{content}
  Places a note in the margin of the page.
 ⟨pos⟩: left
                                                                                           alignment
    Either left or right.
 ⟨gutter⟩: 0.5em
                                                                                              length
    Spacing between note and textarea.
 ⟨dy⟩: "-1pt"
                                                                                              length
   How much to shift the note up or down.
                                                                                             content
  ⟨body⟩
```

```
Content of the note.
\#mty.idx-term(\langle term \rangle) \rightarrow str
   Removes special characters from \(\text{term}\) to make it a valid format for the index.
  ⟨term⟩
                                                                                          str content
    The term to sanitize.
\#mty.idx(\langle term \rangle: none, \langle hide \rangle: false, \langle kind \rangle: "term")[\langle body \rangle] \longrightarrow (none | content)
  Adds <term> to the index.
  Each entry can be categorized by setting <kind>. #make-index() can be used to generate the
  index for one kind only.
                                                                                          str | content
  <term>: none
    An optional term to use, if it differs from <body>.
  ⟨hide⟩: false
                                                                                                     bool
    If true, no content is shown on the page.
  ⟨kind⟩: "term"
                                                                                                      str
    A category for ths term.
                                                                                                 content
  ⟨body⟩
    The term or label for the entry.
#mty.make-index(\langle kind\rangle: none, \langle cols\rangle: 3, \langle headings\rangle: (...) => ..., \langle entries\rangle: (...)
\Rightarrow ...) \rightarrow content
  Creates an index from previously set entries.
  ⟨kind⟩: none
                                                                                                      str
    An optional kind of entries to show.
  ⟨cols⟩: 3
                                                                                                      int
    Number of columns to show the entries in.
  \langle \text{headings} \rangle : (...) => ...
                                                                                                function
```

Function to generate headings in the index. Gets the letter for the new section as an argument: $(str) \Rightarrow content$

```
<argument
<entries>: (...) => ...
function
```

A function to format index entries. Gets the index term, the label and the location for the entry: (str, content, location) => content

#mty.ver(..<args>)

Generate a version number from a version string or array. The function takes a variable number of arguments and builds a version string in *semver* format:

- #mty.ver(0,1,1) $\rightarrow 0.1.1$
- #mty.ver(0,1, "beta-1") $\rightarrow 0.1.beta-1$
- #mty.ver("1.0.2") \rightarrow 1.0.2

#mty.name(\langle name \rangle , \langle last \rangle : none) \rightarrow content

Highlight human names (with first- and lastnames).

- #mty.name("Jonas Neugebauer") \rightarrow Jonas Neugebauer
- #mty.name("J.", last:"Neugebauer") \rightarrow J. Neugebauer

```
Argument (name) str
```

```
Argument (last): none

Optional last name.
```

$\#mty.author(\langle info \rangle) \rightarrow content$

Show author information.

- #mty.author("Jonas Neugebauer") \rightarrow Jonas Neugebauer
- #mty.author((name:"Jonas Neugebauer")) → Jonas Neugebauer
- #mty.author((name:"Jonas Neugebauer", email:"github@neugebauer.cc")) \rightarrow Jonas Neugebauer <github@neugebauer.cc>

```
Argument str | dictionary
```

Either a string with an author name or a dictionary with the name and email keys.

```
\texttt{#mty.date}(\langle d \rangle, \ \langle format \rangle \colon \ \texttt{"[year]-[month]-[day]")} \longrightarrow \boxed{content}
```

Show a date with a given format.

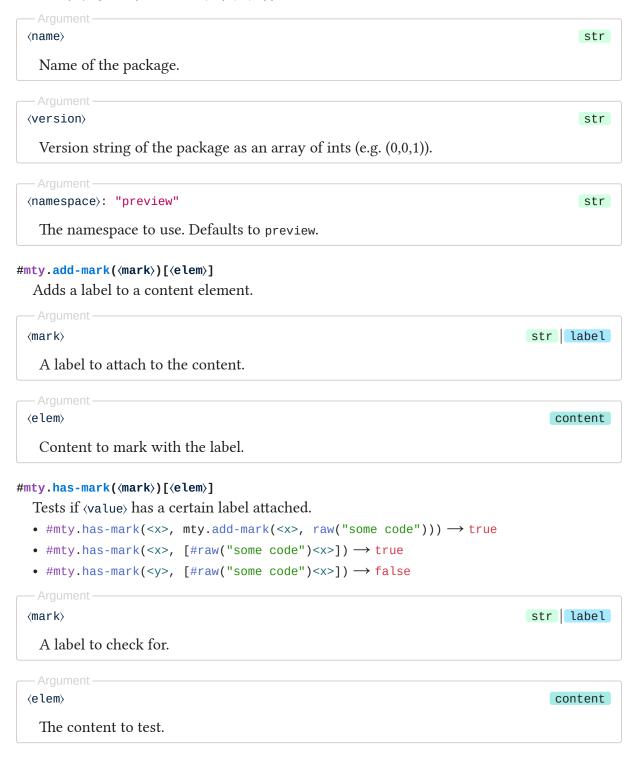

- #mty.date("2023-09-25") \rightarrow 2023-09-25
- #mty.date(datetime.today()) \rightarrow 2024-04-29

```
Argument datetime str
```

Either a date as a string or datetime. <format>: "[year]-[month]-[day]" str An optional datetime format string. #mty.package(<name>) Show a package name. • #mty.package("codelst") → CODELST ⟨name⟩ str Name of the package. #mty.module(<name>) Show a module name. • #mty.module("util") → util ⟨name⟩ str Name of the module. #mty.footlink($\langle url \rangle$, $\langle label \rangle$) \rightarrow content Creates a link with an attached footnote showing the \urls. • #mty.footlink("https://neugebauer.cc", "neugebauer.cc") → neugebauer.cc⁶ ⟨url⟩ str The url for the link and the footnote. ⟨label⟩ str The label for the link. $\#mty.gitlink(\langle repo \rangle) \rightarrow content$ Creates a link to a GitHub repository given in the format user/repository and shows the url in a footnote. • #mty.gitlink("jneug/typst-mantys") → jneug/typst-mantys⁷ str ⟨repo⟩ Identifier of the repository. #mty.pkglink(\langle name \rangle , \langle version \rangle , \langle namespace \rangle : "preview") \rightarrow content ⁶https://neugebauer.cc ⁷https://github.com/jneug/typst-mantys

Creates a link to a Typst package in the Typst package repository at typst/packages.

• #mty.pkglink("codelst", (2,0,0)) \rightarrow CODELST:2.0.08

#mty.place-marker(<name>)

Places an invisible marker in the content that can be modified with a #show rule.

⁸https://github.com/typst/packages/tree/main/packages/preview/codelst/2.0.0

```
This marker not replaced: #mty.place-marker("foo1")
       #show mty.marker("foo1"): "Hello, World!"
       Here be a marker: #mty.place-marker("foo1")
       Here be a marker, too: #mty.place-marker("foo2")
   This marker not replaced:
   Here be a marker: Hello, World!
   Here be a marker, too:
                                                                                    str
   Name of the marker to be referenced later.
#mty.marker(<name>)
  Creates a selector for a marker placed via #place-marker().
       #show mty.marker("foo1"): "Hello, World!"
       Here be a marker: #mty.place-marker("foo1")\
       Here be a marker, too: #mty.place-marker("foo2")
   Here be a marker: Hello, World!
   Here be a marker, too:
                                                                                    str
 ⟨name⟩
   Name of the marker to be referenced.
\#mty.sourcecode(..\langle args \rangle) \rightarrow content
  Shows sourcecode in a frame.
    Uses CODELST to render the code.
  See Section II.2.3 for more information on sourcecode and examples.
                                                                                    any
 ..⟨args⟩
   Argumente für #codelst.sourcecode()
#mty.code-example(
  ⟨side-by-side⟩: false,
  ⟨scope⟩: "(:)",
  <mode>: "markup",
  ⟨breakable⟩: false,
  ..⟨args⟩
)[<example-code>]
```

Show an example by evaluating the given raw code with Typst and showing the source and result in a frame.

See section II.2.3 for more information on sourcecode and examples.

```
⟨side-by-side⟩: false
                                                                                    bool
   Shows the source and example in two columns instead of the result beneath the source.
 ⟨scope⟩: "(:)"
                                                                             dictionary
   A scope to pass to eval.
 <mode⟩: "markup"
                                                                                     str
   The evaulation mode: "markup" | "code" | "math"
 ⟨breakable⟩: false
                                                                                    bool
   If the frame may brake over multiple pages.
 ⟨example-code⟩
                                                                                 content
   A raw block of Typst code.
                                                                                content
 ..⟨args⟩
   An optional second positional argument that overwrites the evaluation result. This can
   be used to show the result of a sourcecode, that can not evaulated directly.
#primary
    Highlights some content with the primary color.
#secondary
    Highlights some content with the secondary color.
#mark-arg
     Mark content as an argument.
#is-arg
    Test if (value) is an argument created with #arg().
#not-is-arg
    Test if (value) is no argument created with #arg().
#mark-body
     Mark content as a body argument.
#is-body
    Test if <value is a body argument created with #barg().
```

```
#not-is-body
    Test if (value) is no body argument created with #barg().
     Mark content as an argument sink.
#is-sink
    Test if (value) is an argument sink created with #sarg().
#not-is-sink
    Test if (value) is no argument sink created with #sarg().
#mark-choices
     Mark content as a choices argument.
#is-choices
    Test if (value) is a choice argument created with #choices().
#not-is-choices
    Test if \( \text{value} \) is no choice argument created with \( \psi \) hoices().
#mark-func
     Mark content as a function argument.
#is-func
    Test if (value) is a function argument created with #func().
#not-is-func
     Test if (value) is no function argument created with #func().
#mark-lambda
     Mark content as a lambda argument.
#is-lambda
    Test if (value) is a lambda argument created with #lambda().
#not-is-lambda
    Test if (value) is no lambda argument created with #lambda().
#lineref
    Show a reference to a labeled line in a sourcecode.
      Uses CODELST to show the reference.
```

II.2.8. Tidy template

```
#get-type-color() #show-outline() #show-parameter-list()
#show-function() #show-parameter-block() #show-type()
```

```
\#mty-tidy.get-type-color(\langle type \rangle) \rightarrow color
```

Returns the color for a specific type.

```
⟨type⟩
                                                                                                 any
    Type to get the color for.
\#mty-tidy.show-outline(\langlemodule-doc\rangle, \langlestyle-args\rangle: none) \rightarrow content
  Shows the outline of a module (list pf functions).
  <module-doc>
                                                                                         dictionary
    Parsed module data.
  ⟨style-args⟩: none
                                                                                         dictionary
    Styling arguments.
#mty-tidy.show-type(\langle type\rangle, \langle style-args\rangle: "(:)")
  Create beautiful, colored type box
\#mty-tidy.show-parameter-list(\langle fn \rangle, \langle display-type-function \rangle) \longrightarrow content
  Show a list of arguments for a given function.
  \langle fn \rangle
                                                                                         dictionary
    Parsed function dictionary.
#mty-tidy.show-parameter-block(
   ⟨name⟩,
  <types>,
  ⟨style-args⟩,
   <show-default>: false,
   <default>: none
) [\langle content \rangle] \rightarrow content
  Create a parameter description block, containing name, type, description and optionally the
  default value. Passes the parameter information to #argument().
  ⟨name⟩
                                                                                                 str
    Name of the function.
  ⟨types⟩
                                                                                               array
    Array of possible types.
  ⟨content⟩
                                                                                            content
   Description of the argument.
```
